

Chapter 3: Conditional Instructions

Sometimes we want to watch comedy videos on youtube if the day is Sunday. Sometimes we order junk food if it is our friend's birthday in the hostel. You might want to buy an umbrella if it's raining and you have the money. You order the meal if dal or your favorite bhindi is listed on the menu.

All these are decisions that depend on conditions being met.

In 'C' language, too, we must be able to execute instructions on a condition(s) being met.

Decision-making instructions in C

- If-else statement
- Switch statement

If-else statement

The syntax of an if-else statement in c looks like this:

```
if ( condition to be checked) {  
  
    Statements-if-condition-true ;  
  
}  
  
else{  
  
statements-if-condition-false ;  
  
}
```

Copy

Code Example

```
int a=23;  
if (a>18){  
printf("you can drive\n");  
}
```

Copy

Note that else block is not necessary but optional.

Relational Operators in C

Relational operators are used to evaluate conditions (true or false) inside the if statements. Some examples of relational operators are:

`==` equals to

`>=` greater than or equal to

`>` greater than

`<` less than

`<=` less than or equal to

`!=` not equal to

Important Note: `'=`' is used for an assignment, whereas `'=='` is used for an equality check.

The condition can be any valid expression. In C, a non-zero value is considered to be true.

Logical Operators

`&&`, `||`, and `!` are the three logical operators in C. These are read as “and,” “or,” and “not.” They are used to provide logic to our c programs.

Use of logical operators:

1. `&&` (AND) is true when both the conditions are true

“`1` and `0`” is evaluated as false

“`0` and `0`” is evaluated as false

“`1` and `1`” is evaluated as true

2. `||` (OR) is true when at least one of the conditions is true. (`1` or `0 = 1`)(`1` or `1 = 1`)

3. `!` returns true if given false and false if given true.

`!(3==3)` evaluates to false

```
!(3>30) evaluates to true
```

Copy

As the number of conditions increases, the level of indentation increases. This reduces readability. Logical operators come to the rescue in such cases.

Else if clause

Instead of using multiple if statements, we can also use else if along with if, thus forming an if-else if-else ladder.

```
if {  
  
    // statements ;  
  
}  
  
else if { //statements;  
  
    }  
  
else { //statements;  
  
    }
```

Copy

Using if-else if-else reduces indents. The last “else” is optional. Also, there can be any number of “else if.”

Last else is executed only if all conditions fail.

Operator Precedence

Priority Operator

1 st	!
2 nd	*,/,%
3 rd	+, -
4 th	<>, <=, >=
5 th	==, !=
6 th	&&
7 th	
8 th	=

Conditional operators

A shorthand “if-else” can be written using conditional or ternary operators.

```
Condition ? expression-if-true ; expression-if-false
```

Copy

Here, '?' and ':' are Ternary operators.

Switch case-control instruction

Switch-case is used when we have to make a choice between the number of alternatives for a given variable.

Syntax,

```
Switch(integer-expression)
```

```
{
```

```
Case c1:
```

```
    Code;
```

```
Case c2:
```

```
//c1,c2,c3 are constants
```

```
    Code;
```

```
//Code is any valid C code
```

```
Case c3:
```

```
    Code;
```

```
default:
```

```
    Code;
```

```
}
```

Copy

The value of integer-expression is matched against c1,c2,c3.....if it matched any of these cases, that case along with all subsequent “case” and “default” statements are executed.

Quick Quiz: Write a program to find the grade of a student given his marks based on below:

90-100	A
80-90	B
70-80	C
60-70	D
<70	F

Important notes

- We can use switch case statements even by writing in any order of our choice
- Char values are allowed as they can be easily evaluated to an integer
- A switch can occur within another, but in practice, this is rarely done

Chapter 3- Practice Set

1. What will be the output of this program?

```
int a=10;

if(a=11)
    printf("I am 11");
else
    printf("I am not 11");
```

Copy

2. Write a program to find out whether a student is pass or fail; if it requires a total of 40% and at least 33% in each subject to pass. Assume 3 subjects and take marks as input from the user.
3. Calculate income tax paid by an employee to the government as per the slabs mentioned below:

Income Slab Tax

2.5L-5.0L 5%

5.0L-10.0L 20%

Above 10.0L 30%

Note that there is no tax below 2.5L. Take income amount as an input from the user.

4. Write a program to find whether a year entered by the user is a leap year or not. Take the year as input from the user.
5. Write a program to determine whether a character entered by the user is lowercase or not.
6. Write a program to find the greatest of four numbers entered by the user.

KEEP LEARNING & KEEP PRACTICING 😊
